Examines how the European Union has handled environmental protection issues. Significant changes in how the world approaches global environmental problems have occurred since the late 1970s. Countries have become increasingly aware of the " borderless " nature of environmental issues, i.e., that production and consumption in one country can spill over to affect another country ' s environment. Protecting Our Environment considers the successes that have been achieved in the European Union (EU), as well as issues the Union still faces regarding the protection of the environment in the future. Authors Janet R. Hunter and Zachary A. Smith identify the factors that have allowed the EU to form a successful environmental regime, including the development of the environmental management approach and the principles upon which it is based. They examine in detail the challenges that have been encountered in the implementation of environmental programs, and the solutions that have been developed to address those challenges. Also considered is how economic development and environmental protection have been reconciled within the EU. By analyzing the successful example of the EU, Protecting Our Environment provides a model for a contemporary approach to global environmental problems. Janet R. Hunter is Chair of Administrative Information Services at Northland Pioneer College. Zachary A. Smith is Regents Professor of Political Science at Northern Arizona University. He is the author or editor of many books, including The Environmental Policy Paradox, Fourth Edition.

Environmental Solutions In Europe Need To

On November 1-5, 1994, the Energy & Environmental Research Center (EERC) and Power Research Institute of Prague cosponsored their second conference since 1991 in the Czech Republic, entitled"Energy and Environment: Transitions in East Central Europe." This conference was a continuation of the EERC's joint commitment, initiated in 1190, to facilitate solutions to short- and long-term energy and environmental problems in East Central Europe. Production of energy from coal in an environmentally acceptable manner is a critical issue facing East Central Europe, because the region continues to rely on coal as its primary energy source. The goal of the conference was to develop partnerships between industry, government, and the research community in East Central Europe and the United States to solve energy and environmental issues in a manner that fosters economic development. Among the topics addressed at the conference were: conventional and advanced energy generation systems; economic operation of energy systems; air pollution controls; power system retrofitting and repowering, financing options; regulatory issues; energy resource options; waste utilization and disposal; and long-range environmental issues. Selected papers in the proceedings have been processed separately for inclusion in the Energy Science and Technology database.

Authored by international experts from academia, international organizations, governments and NGOs, this book highlights the main environmental security issues in the South-East European (SEE) countries, with a particular focus on climate change and water management. The common goal of the authors was to provide a reliable evaluation of whether existing legal regimes and correct implementation of applicable international treaties may contribute to reducing environmental security risks in the region. In-depth analyses and assessment of major challenges in compliance, serve as a firm ground which such evaluation is based on. This volume is recommended for public officials, legal practitioners and consultants. Its interest may also extend beyond the SEE countries, serving as a case-study of a broader and paradigmatic relevance of the analysis and management of environmental and security issues in a trans-boundary context.

This book aims to take stock of the state of environmental degradation in Europe from theoretical and empirical point of views. It focuses on international organizations and institutions in Europe that deal with ecological problems and integrates case studies on regional environmental cooperation.

This book presents an overview of the field of environmental law and policies within the European Union, from theoretical foundations to major issues and applied governance solutions. Drawing on expertise from renowned academics and practitioners from different disciplines, EU Environmental Governance: Current and Future Challenges helps readers to understand the main legal, political and economic issues of environmental protection since the adoption of the Paris Agreement by the European Union in 2015, until the 2020 Brexit, European Green Deal and coronavirus outbreak. The authors examine a broad range of sensitive and topical environmental issues including climate change, air pollution, waste management and circular economy, nuclear waste, biodiversity, agriculture, chemicals, nanotechnology, the environmental impacts of trade and environmental conflicts, presenting both current insights and future challenges. Overall, this volume exposes the reader to a vast array of empirical case studies, which will bolster their training and help tackle the environmental challenges faced by Europe today. This book is a valuable resource for students, researchers and policymakers across a broad range of fields, including environmental law and policies, environmental economics, climate science and environmental sociology.

Selling products used to be the standard way of doing business. Traditionally, it is left to the user to transform the purchase of a product into something that fulfils effectively a final-user need. Today, two streams of research – business management and sustainability – normally with very distinct perspectives on the world, have surprisingly converged to form a common conclusion: selling products is old-fashioned business. Companies should switch their focus to selling need fulfilment, satisfaction, or experiences. Or, in other words, selling integrated solutions or product-services. The business management literature argues that, by focusing on the integrated, final-client needs, and delivering integrated solutions fulfilling these needs, companies will be able to improve their position in the value chain, enhance added value of their offering, and improve their innovation potential. In a business world where many products are becoming equally well-performing commodities, this strategy is one of the ways to avoid a sheer competition on price – a type of competition that Europe never can win with emerging and low-cost economies such as China. In

that sense, product-services can mean new business for old Europe. The sustainability knowledge stream argues that need-focused solutions could be inherently more sustainable than products. Product-services could offer the value of use instead of the product itself and decrease the environmental load in two ways. First, companies offering the service would have all the incentives to make the (product-)system efficient, as they get paid by the result. Second, consumers would be encouraged to alter their behaviour as they gain insight into all the costs involved with the use. Until today, the connections and interchange between the two research streams have been quite limited. The question of whether product-services truly are the avenue to a sustainable world is still under discussion. This book aims to develop a systematic view on this issue. The potential of product-services to enhance competitiveness and contribute to sustainable development prompted the EU to invest heavily in the theme under the EU's 5th Framework Programme (FP5; 1997-2002). A variety of research and development projects in the field were supported under the umbrella of the Sustainable Product Development Network (SusProNet). These included MEPSS (Methodology Product Service Systems); Home Services; HiCS (Highly Customised Solutions); Prosecco (Product-Service Co-design); and Innopse (Innovation Studio and exemplary developments for Product-Service). The projects were undertaken by a mix of European research institutions and companies including Orange, Philips and Nokia. Some of these projects focused on developing methods that could help industries change their output from a product to a service. Others focused on the development of new product-services or solutions (HiCS, Prosecco, Innopse), and yet others tried to analyze under which circumstances product-services are likely to be implemented and accepted by consumers (Home Services). One project focused on dissemination of the concept to SMEs (Lean Services). Other projects focused purely on new product-service development, such as Brainfridge (an intelligent fridge managing its supply chain), ASP-NET (application service providers), Protex (intelligent enzymes) and IPSCON (receivers for wireless telephones). New Business for Old Europe brings together the key outputs from all of these groups to present a state-of-the-art collection on product-service development, prospects and implications for competitiveness and sustainability. The book has a number of aims. First, it attempts to bridge the gap between business and sustainability literature to lead to a better-founded understanding of the business drivers for embarking on product-service development, and its relation with sustainability and competitiveness. Second, the book reviews the large amount of studies that have developed toolkits, methods and approaches that can support marketers, product developers and strategists in business to develop product-services, selects the best-practice approaches and analyses any gaps. Third, the book examines what opportunities there are for product-service development in a variety of key areas including base materials, information and communication technologies, offices, food and households. Each chapter in this section discusses the area, developments that will stimulate or hinder the market opportunities for product-services, product-service examples, and typical implementation challenges for product-services in that area. These chapters serve as a quick introduction for companies interested in developing product-services in a specific area. Fourth, the book translates all the lessons into suggested approaches for product-service development by companies. Annexes include a lightweight "product-service development manual" and an alphabetical list of useful underlying tools.

This book aims to further advance analysis on Negotiated Environmental Agreements (NEAs) in a multi-disciplinary and co-ordinated way. The authors advocate increased use of NEAs as policy instruments to deal with environmental problems. The book analyses, both theoretically and through the example of existing European agreements, the critical factors that can influence the performance of a negotiated environmental agreement. Negotiating Environmental Agreements in Europe contains 12 case studies analysing 12 different negotiated agreements in European countries. These are analysed comparatively in order to examine to what extent the different hypotheses postulated in the book are valid.

This volume contains papers presented in a workshop of international experts in September 2008 in Berlin. The experts discussed how environmental consequences of EU legislation can be incorporated in a more effective way. In other words, this contribution focuses on the question of which measures can strengthen the consideration of environmental effects in the EU impact assessment procedure and in the subsequent legislative decision-making process. This allows drawing conclusions for the impact assessment process in Germany. This volume begins with an introductory paper (Bizer/Lechner/Führ) which served as the basis for discussion in our workshop. The questions raised in this paper are addressed by the authors of the subsequent chapters. Stephen White (DG Environment, EU-Commission) discusses the impact assessment from an internal perspective within the Commission. Pendo Maro (European Environmental Bureau) reviews the impact assessment practice from the perspective of an environmental NGO. Martin Schmidt et al. discuss the potential for more formalism to strengthen environmental issues within impact assessments and favour a checklist.
