David F. Evans's memoir follows his career from his first job as a civil engineer through the founding and growth of his consulting engineering firm, David Evans and Associates, Inc.. Evans details how the firm grew from two to over 900 people in spite of recessions, economic bubbles, and the technological transition from the drafting table and slide rule to the computer, and how the firm prepared carefully for a successful transition to the next generation of leaders. David Evans and Associates, Inc. continues as one of the largest and most successful consulting engineering firms in the United States. David's lively, humorous and compelling story is recommended reading for anyone considering a career as a consulting engineer.

Understand vital business factors that are central to modern land development projects As real estate development evolves to accommodate increasingly more complex regulation and sophisticated built structures, so too must the roles of different members of the development team evolve. The entire development team, including architects and civil engineers, must participate actively in consulting throughout the entire lifecycle of modern development projects. This expanded role often means that contemporary design team members may find themselves involved in contentious, cross-disciplinary decisions that their predecessors did not have to address. This comprehensive textbook explores the entire development process from an applied perspective to provide architects, civil engineers, and other team members with an understanding of the context in which real estate development occurs. Presented by an industry-leading design firm, the book offers complete explanations of all business considerations that influence land development projects at every stage. Development of the Built Environment: From Site Acquisition to Project Completion provides a holistic view of the development process and enables the development team to more effectively complete projects of all sizes and budgets. This text includes detailed coverage of:

- Developers and the development process
- Public and private project types
- Recognizing opportunity
- Selecting and controlling the site
- Planning and creating the built environment
- Key considerations for designing the project
- Preliminary financial analysis and planning
- Plan approval, permit issuance, construction, and completion

This edited collection critically engages with an important but rarely-asked question: what is energy for? This starting point foregrounds the diverse social processes implicated in the making of energy demand and how these change over time to shape the past patterns, present

dynamics and future trajectories of energy use. Through a series of innovative case studies, the book explores how energy demand is embedded in shared practices and activities within society, such as going to music festivals, cooking food, travelling for business or leisure and working in hospitals. *Demanding Energy* investigates the dynamics of energy demand in organisations and everyday life, and demonstrates how an understanding of spatiality and temporality is crucial for grasping the relationship between energy demand and everyday practices. This collection will be of interest to researchers and students in the fields of energy, climate change, transport, sustainability and sociologies and geographies of consumption and environment. Chapters 1 and 15 of this book are available open access under a CC BY 4.0 license at link.springer.com
