## Solids, liquids and gases - The three states of matter ...

In physics, a state of matter is one of the distinct forms in which matter can exist. Four states of matter are observable in everyday life: solid, liquid, gas, and plasma. Many intermediate states are known to exist, such as liquid crystal, and some states only exist under extreme conditions, such as Bose – Einstein condensates, neutron-degenerate matter, and quark – gluon plasma, which only occur, respectively, in situations of extreme cold, extreme density, and extremely high energy.

Almost all substances can be classified into three states of matter – solids, liquids and gases. Each state has different properties. Heating and cooling a substance can cause it to change state.

## States of matter - States of matter - GCSE Chemistry ...

The three states of matter are the three distinct physical forms which matter can take in most environments: solid, liquid, and gas. Other states, such as plasma, Bose-Einstein condensate, and neutron stars, may be present in extreme environments. In this article, we have studied the three states of matter.

## Definition, Classification ...

States of matter are distinguished by changes in the properties of matter associated with external factors like pressure and temperature. States are usually distinguished by a discontinuity in one of those properties: for example, raising the temperature of ice produces a discontinuity at  $0^{\circ}\text{C}$  ( $32^{\circ}\text{F}$ ) as energy goes into a phase transition, rather than temperature increase.
